

FLUID COOLING | Shell & Tube A Series

COPPER & STEEL CONSTRUCTION

Features

- ITT Interchange
- B or C Series is Recommended for New Applications
- Competitively Priced
- Optional Non-Ferrous Construction (Water-to-Water Service)
- Optional 90/10 Copper Nickel Cooling Tubes and Bronze End Bonnets for Sea Water Service
- NPT, SAE O-Ring, SAE Flange, or BSPP Shell Side Connections Available
- End Bonnets Removable for Servicing
- Mounting Feet Included (May be Rotated in 90° Increments)

WATER COOLED A

Ratings

- Maximum Shell Pressure** 300 psi
- Maximum Tube Side Pressure** 150 psi
- Maximum Temperature** 300° F

Materials

- Tubes** Copper
- Hubs & Tubesheets** Steel or Brass
- Shell** Steel
- Baffles** Brass
- End Bonnets** Cast Iron
- Mounting Brackets** Steel
- Gaskets** Nitrile Rubber/Cellulose Fiber
- Nameplate** Aluminum Foil

Model Series		Model Size Selected		Baffle Spacing		Tube Diameter Code		Tubeside Passes		Shell Material		Cooling Tube Material		End Bonnet Material		Zinc Anodes
SA SAF A AS AM AF AFM						4 - 1/4" 6 - 3/8"		0 - One Pass T - Two Pass F - Four Pass		Blank - Steel BR - Brass		Blank - Copper CN - CuNi		Blank - Cast Iron B - Bronze		Blank - None Z - Zinc

SA = NPT Shell side, NPT Tube
 SAF = SAE 4 Bolt Flange (with UNC threads) Shell side connections; NPT Tube side connections
 A = NPT Shell side connections; NPT Tube side connections
 AS = SAE O-Ring Shell side connections; NPT Tube side connections
 AM = BSPP Shell side connections; BSPP Tube side connections
 AF = SAE 4 Bolt Flange (with UNC threads) Shell side connections; NPT Tube side connections
 AFM = SAE 4 Bolt Flange (with Metric threads) Shell side connections; BSPP Tube side connections
SAE flanges available on some models. Consult factory for details.

Piping Hook-up

Specific applications may have different piping arrangements. Contact factory for assistance.

WATER COOLED A

Selection Procedure

Performance Curves are based on 100SSU oil leaving the cooler 40°F higher than the water temperature used for cooling. This is also referred to as a 40°F approach temperature. Curves are based on a 2:1 oil to water flow ratio.

Step 1 Determine the Heat Load. This will vary with different systems, but typically coolers are sized to remove 25 to 50% of the input nameplate horsepower. (Example: 100 HP Power Unit x .33 = 33 HP Heat load.)
If BTU/Hr. is known: $HP = \frac{BTU/Hr}{2545}$

Step 2 Determine Approach Temperature. Desired oil leaving cooler °F – Water Inlet temp. °F = Actual Approach (Max. reservoir temp.)

Step 3 Determine Curve Horsepower Heat Load. Enter the information from above:
Horsepower heat load x $\frac{40}{\text{Actual Approach}}$ x Viscosity = Curve Horsepower
Correction A

Step 4 Enter curves at oil flow through cooler and curve horsepower. Any curve above the intersecting point will work.

Step 5 Determine Oil Pressure Drop from Curves:
○ = 5 PSI; □ = 10 PSI; ● = 20 PSI. Multiply pressure drop from curve by correction factor B found on oil viscosity correction curve.

Oil Temperature

Oil coolers can be selected using entering or leaving oil temperatures.

Typical operating temperature ranges are:
Hydraulic Oil 110°F - 130°F
Hydrostatic Drive Oil 130°F - 180°F
Bearing Lube Oil 120°F - 160°F
Lube Oil Circuits 110°F - 130°F

Desired Reservoir Temperature

Return Line Cooling: Desired temperature is the oil temperature leaving the cooler. This will be the same temperature that will be found in the reservoir.

Off-Line Recirculation Cooling Loop: Desired temperature is the oil temperature entering the cooler. In this case, the oil temperature change must be determined so that the actual oil leaving temperature can be found. Calculate the oil temperature change (oil ΔT) with this formula:
Oil $\Delta T = (BTU's/Hr.) / (GPM \text{ Oil Flow} \times 210)$.

To calculate the oil leaving temperature from the cooler, use this formula:
Oil Leaving Temp. = Oil Entering Temp – Oil ΔT .

This formula may also be used in any application where the only temperature available is the entering oil temperature.

Oil Pressure Drop: Most systems can tolerate a pressure drop through the heat exchanger of 20 to 30 PSI. Excessive pressure drop should be avoided. Care should be taken to limit pressure drop to 5 PSI or less for case drain applications where high back pressure may damage the pump shaft seals.

Maximum Flow Rates
